Increasing safety.  
Simplifying setup.**

DoorScan®

Presence Sensor for  
Automatic Doors

DoorScan®

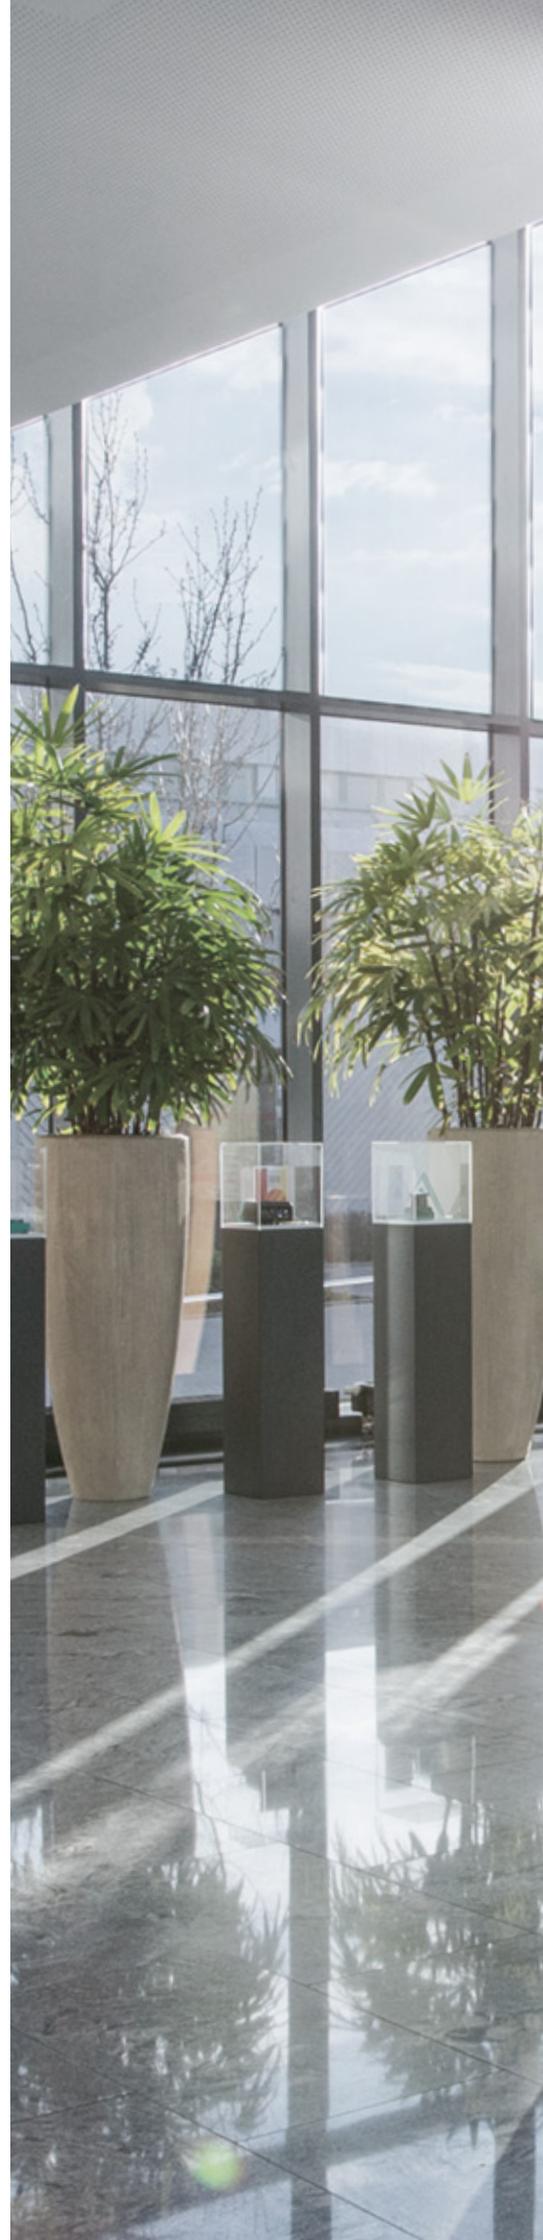

# Uncompromisingly Safe and Remarkably User- Friendly: DoorScan from Pepperl+Fuchs

**Automatic doors are an integral part of modern buildings. Sensor solutions for these doors must meet demanding requirements. DoorScan sets the standard, combining maximum safety with effortless installation so you can open up endless application possibilities.**

## **Safety That Sets the Standard**

DoorScan is a presence sensor that scans the areas directly in front of and behind doors to keep people and objects from colliding with them. The universal system ensures reliable detection in any situation due to intelligent wall suppression that functions even when doors are fully open. The convenient snap-in mechanism enables modules to be mounted quickly and without any tools, and the system is taught by simply pressing the Teach button. The sensor solution is certified in accordance with DIN 18650 and complies with European standard EN 16005.

DoorScan by Pepperl+Fuchs works using active infrared with background evaluation and is suitable for operation in both stationary and mobile environments. The sensor forms a continuous rectangular detection field on each side of the door. If a person or object breaks one or more of the protective light beams near the door, the door stops moving immediately, guaranteeing collision protection at all times.

In accordance with  
**EN16005**

# Perfectly Combined: Maximum Collision Prevention and Excellent Flexibility

When using automatic doors, safety is the top priority. DoorScan from Pepperl+Fuchs offers the highest possible level of safety and dependable collision prevention—anytime and anywhere.

## **An Exceptional Level of Protection for Closing Doors (1)**

To ensure the safe operation of automatic doors, it is crucial for people and objects to be detected quickly and reliably when they approach the edge of a closing door. The position of the outer beams enables DoorScan to offer increased safety at the main and secondary closing edges and protects people and objects from colliding with the door.

## **Collision Protection Until Doors are Fully Open (2)**

Intelligent wall suppression allows DoorScan to provide complete protection up to the wall without sensor shutoff. The wall is automatically taught in at the touch of a button during setup, ensuring collision protection up to and including when a door is completely open.

## **Maximum Flexibility due to Adjustable Protection Field (3)**

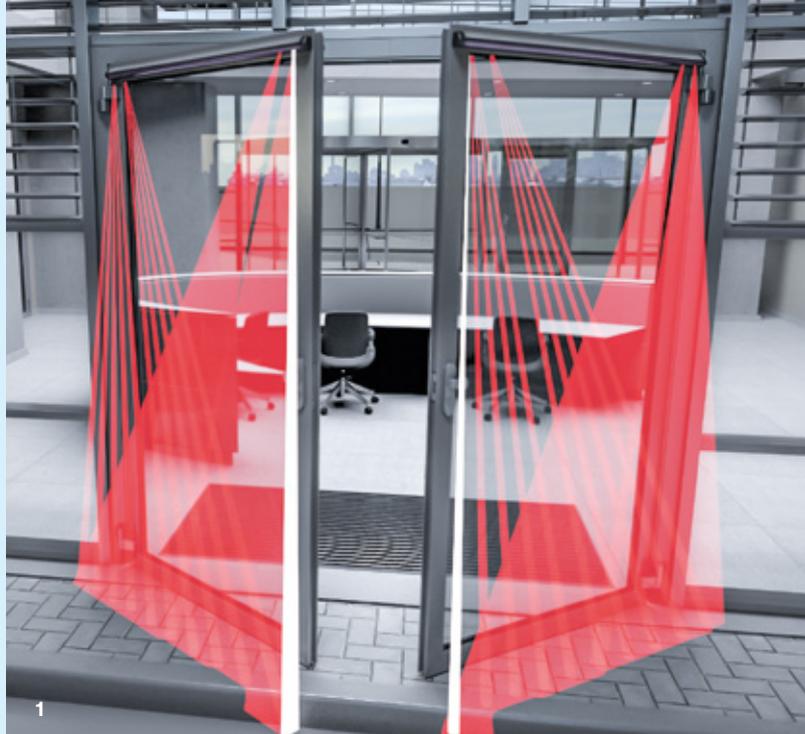

When unlocked, the DoorScan modules can be moved freely in the sensing strip. The width of the detection field increases or decreases depending on the distance between the transmitter and receiver modules. This expanded sensing area enables precise adaptation to various door widths and therefore maximum flexibility when using DoorScan.

## **Compatible with Any Door Controller**

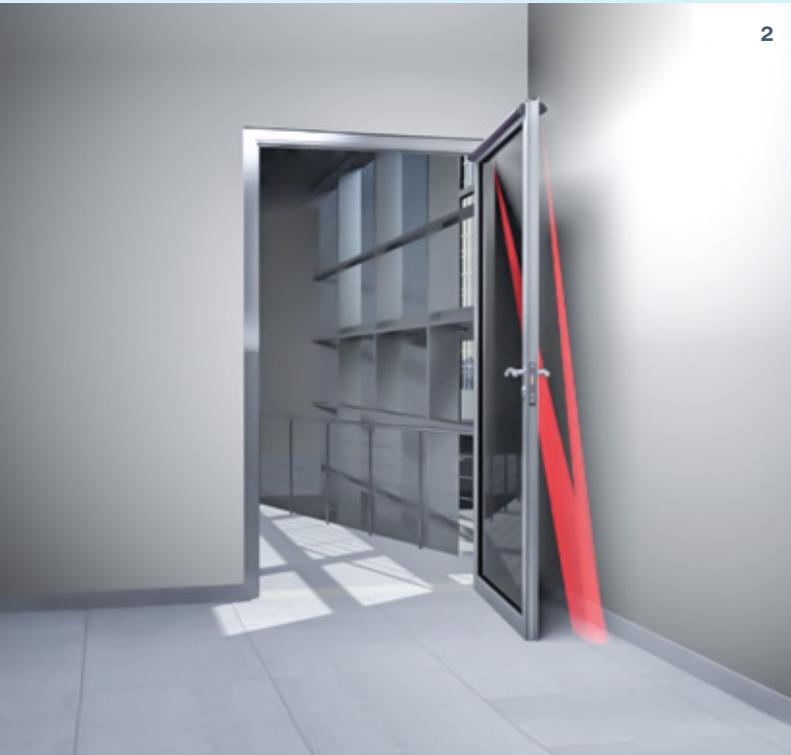

The latest version of DoorScan is equipped with one NPN output and one PNP output and can be used with any controller. Adjusting the switching mode is easy via the plug-in jumper. With its slim profile, DoorScan is an attractive addition to any door design.

## **Reliable Operation in Any Environment**

Reflective walls, dark mats, shiny stone slabs, or grids in front of the doors—there are a number of challenges for presence sensors to contend with in day-to-day operation. In spite of these challenges, DoorScan always functions reliably. With the new advanced GRID mode, DoorScan has no problems whatsoever with even the most challenging surroundings such as grid bridges.

1

### Highlights

- Intelligent wall suppression provides complete protection up to the wall without sensor shutoff
- The position of the outer beams provides improved collision protection at the closing edges
- Reliable operation in any environment leads to unlimited application possibilities
- Freely moving transmitter and receiver modules provide a flexible, adjustable protection field

3

# Installation—Simple and Highly Efficient

Fast, tool-free installation and commissioning via the teach button. The DoorScan installation is characterized by simple handling and takes very little time.

DoorScan: transmitter, interface, and receiver module

## Time-Saving Setup

DoorScan setup is quick and easy with the multifunction interface module, which supplies and monitors the sensor components on both sides of the door. Simply pressing the Teach button starts the automatic teach-in function. Challenging installation situations such as protruding door jambs are no problem whatsoever for DoorScan, since the higher outer beams can be switched off easily using the DIP switches. The integrated wall suppression function can also be switched off, speeding up teach-in time when no wall is present.

## Unique Color-Coding System

All DoorScan parts can be identified by the specific color of their housing: red designates transmitter modules, blue designates receiver modules, and green designates the interface module. This saves time during installation. Because all of the connection cables are preassembled with plug-in terminals, you can connect the system quickly and without tools.

## Fast, Tool-Free Mounting with Snap-In Modules

Modules can be attached to the sensor strip via a snap-in mechanism and are locked into place using the module lever—a simple process that does not require any tools. When unlocked, the modules can be moved as required to adjust the detection field to different door widths. These features result in an efficient, time-saving installation.
